## The Exponential Function

1. Graph each of the following using a table of values.

b) $y=\left(\frac{1}{2}\right)^{x}$

What do you notice about the finite differences? $\qquad$
Both of these equations are of the form $y=b^{x}$ and pass through the point $\qquad$
If the $b>1$, the curve will $\qquad$ If $0<b<1$ the curve will $\qquad$
Curves of growth increase $\qquad$ at first and then more $\qquad$ later on.

Curves of decay decrease $\qquad$ at first and then more $\qquad$ later on.

Domain $\qquad$ Range $\qquad$
Both graphs get very close to the x -axis but never cross it.
The x -axis is called the $\qquad$ It's equation is $\qquad$
2. Graph each of the following using a table of values.
a) $y=4(2)^{x}$

b) $y=3\left(\frac{1}{2}\right)^{x}-5$

For the exponential function $y=a b^{x}+c$ what is the
vertical slide? $\qquad$ vertical stretch? $\qquad$
equation of the asymptote? $\qquad$
$y$-intercept? $\qquad$

Describe the end behaviour for the 2 graphs above:
a) As $x \rightarrow \infty, y \rightarrow$ $\qquad$ (As $x$ gets infinitely bigger, what does the $y$-value do?)
As $x \rightarrow-\infty, y \rightarrow$ $\qquad$ (As $x$ gets infinitely smaller, what does the $y$-value do?)
b) As $x \rightarrow \infty, y \rightarrow$ $\qquad$
As $x \rightarrow-\infty, y \rightarrow$ $\qquad$
3. Graph each of the following using your knowledge of the $y$-intercept and the asymptote.
$\begin{array}{ll}\text { a) } y=4(3)^{x}-6 & \text { b) } y=2\left(\frac{1}{2}\right)^{x}+1\end{array}$

4. Describe $y=\frac{2}{3}(6)^{x}+12$ as a transformation of $y=6^{n}$.

Write the first in terms of the second using function notation. Let the first equation be $f(x)$ and the second equation be $h(x)$.

## Homework:

1. Graph each of the following functions.
a) $y=3^{x}$
b) $y=4\left(\frac{1}{2}\right)^{x}$

c) $y=3(2)^{x}-8$

d) $y=2\left(\frac{1}{2}\right)^{x}-4$

2. Determine whether each of the following relations are linear, quadratic, exponential, or neither.

| $x$ | $y$ |
| :--- | :--- |
| 0 | 81 |
| 1 | 27 |
| 2 | 9 |
| 3 | 3 |
| 4 | 1 |
| 5 | $1 / 3$ |

| $x$ | $y$ |
| :---: | :---: |
| 0 | 1 |
| 2 | 8 |
| 4 | 15 |
| 6 | 22 |
| 8 | 29 |
| 10 | 36 |

| $x$ | $y$ |
| :---: | :---: |
| 0 | 1 |
| 1 | 18 |
| 2 | 37 |
| 3 | 58 |
| 4 | 81 |
| 5 | 106 |

3. Describe the second equation as a transformation of the first. Write the first in terms of the second using function notation. Let the first equation be $f(x)$ and the second equation be $h(x)$.
a) $y=8^{x}, y=\frac{1}{2}(8)^{x-2}$
b) $y=\left(\frac{1}{4}\right)^{x}, y=9\left(\frac{1}{4}\right)^{-x}-5$
